

WHAT IS CLAIMED IS:

1. A signal processing apparatus for receiving a time divisional multiplexed signal including a plurality of kinds of data, said signal processing apparatus comprising:

processing means for processing plural kinds of operations corresponding to the data of said time divisional multiplexed signal; and

changing means for changing the operation of said processing means to one of said operations, corresponding to the data at the timing of the transit of said data.

2. A signal processing apparatus according to Claim 1, wherein said processing means provides an output generated by said processing means to an input terminal of a device corresponding to each kind of the data of said time divisional multiplexed signal.

3. A signal processing apparatus according to Claim 1, wherein:

said processing means comprises:

first data-extracting means for extracting a plurality of data as class data from said data;

characteristic signal output means for outputting a signal indicating characteristics of said class data based

on said class data; and

generating means for generating output data based on the signal indicating the characteristics.

4. A signal processing apparatus according to Claim 1, wherein:

said processing means comprises:

first data-extracting means for extracting a plurality of data as class data from said data;

characteristic signal output means for outputting a signal indicating characteristics of said class data based on said class data;

second data-extracting means for extracting a plurality of data as generation data from said data;

storage means for storing coefficient information corresponding to the signal indicating the characteristics; and

generating means for generating output data by performing computation using said generation data and said coefficient information.

5. A signal processing apparatus according to Claim 3, wherein said first data-extracting means extracts said class data based on class data forming information set in accordance with an instruction from said changing means.

6. A signal processing apparatus according to Claim 4, wherein said second data-extracting means extracts said generation data based on generation data forming information set in accordance with an instruction from said changing means.

7. A signal processing apparatus according to Claim 4, wherein said storage means stores said coefficient information according to the type of said data, and outputs coefficient information, corresponding to the signal indicating the characteristics, from among said coefficient information corresponding to an instruction from said changing means.

8. A signal processing apparatus according to Claim 1, wherein said changing means comprises finding means for finding the type of said data based on said time divisional multiplexed signal including a plurality of kinds of data.
